ABOUT ME

I'm a BSIT graduate with Latin honors, with a genuine interest in understanding how systems work behind the scenes.

Outside of school, I've been setting up and managing my own Linux-based home server for self-hosting websites locally, working with virtual machines, and handling remote access through SSH. What started as curiosity pushed me to learn networking basics, Linux administration, and web development hands-on rather than just reading about them.

I enjoy figuring things out on my own, and I'm not afraid to break something just to understand how to fix it. I'm looking for an opportunity where I can apply what I've built and learned, contribute to a team, and continue growing—whether that's in systems, backend development, or IT infrastructure.

EDUCATION

2022 - 2026

Pampanga State
University

Bachelor of Science in Information Technology

Relevant Coursework: Networking, System Administration, Web Development, Virtual Machines, Cloud Services, Database Management.

SKILLS & CERTIFICATIONS

Operating System: Windows and Linux

Web: Html, Javascript, CSS, Php

Database: MySQL, SQLite

Networking: Port-Forwarding, SSH, DNS

Tools: Sublime, VScode, Tailscale, VMware,
Github, Nginx, Linux Terminal

Cisco Networking Academy

IT Computer Support Basics

Computer Hardware Basics

Operating Systems Basics

Hardware and Upgrade Support

Operating Systems Support

Security and Connectivity Support

EXPERIENCE

National Irrigation
Administration
(PAMBAT-IMO)

Feb - June 2026

Procurement and Property Unit Technical and Office Support

- Diagnosed and resolved hardware and software issues on office computers and printers, minimizing downtime for daily operations
- Assisted in organizing and maintaining proper storage of government property equipment, ensuring accurate physical inventory
- Managed and updated inventory records of office equipment using Excel, improving tracking accuracy for the unit

PROJECTS

Self-Hosted Web
Development
Environment

- Deployed a Ubuntu Server Virtual Machine in VMware Workstation
- Configured a full LEMP stack (Linux, Nginx, MySQL, PHP) to host and serve web applications locally
- Implemented secure remote access via SSH and Tailscale VPN, enabling management of the server from any network
- Developed and deployed two full-stack web systems — a Farm Management System and a Fleet Fuel Management System — within the local server environment
- Exposed projects to the public internet using Cloudflare tunneling and GitHub Pages for static hosting
